

Global Warming Essay In Pdf File

Discuss the causes of Global Warming

Identify the earth's atmosphere layer at an ideal temperature to sustain life of around 15°C (59°F). The earth is heated by the sun's rays in the form of visible electromagnetic light, the majority of these rays pass through the atmosphere, but the majority of the earth's atmosphere, is made up of gases that are transparent to the sun's rays. The energy, after the earth has absorbed it, is radiated back into space as long wave infrared energy. The 'natural greenhouse effect' is the increased retention of the earth that is explained by the presence of naturally occurring greenhouse gases, and has been observed on other planets (Singer, 1996). Global warming, however, has been and continues to be a major concern for the planet. It is the process by which the earth's climate is gradually increasing in temperature because of a variety of factors but primarily because of human activity, either by emitting vast amounts of greenhouse gases or by disturbing natural sinks that absorb them.

Global warming is generally considered to be occurring because as this energy is radiated back into space the increased amount of greenhouse gases traps it and temperature increases globally. The 'greenhouse effect' is composed of water vapor, carbon dioxide, methane, nitrous oxide and ozone (United Nations Framework Convention on Climate Change (UNFCCC), 2001). It is also referred to as the 'greenhouse effect' at the National Institute for Environmental Health Research (NIEHS) (Houghton, 1994).

There are three main factors contributing to global warming or 'the enhanced greenhouse effect' (Gale, 1994). First, Carbon Dioxide (CO₂) accounts for over 60% of global warming. It is estimated that every year 7000 million tonnes of carbon is released into the atmosphere every year (Gale, 1994). It is estimated that every year, 100 million tonnes of carbon is released into the atmosphere every year (Kemp, et al. 1996). It is also estimated in 1996 and released with the burning of other fossil fuels. This is a major concern, partly because the
